

Grit and Bar Screen Materials

Roll Off Container Filters

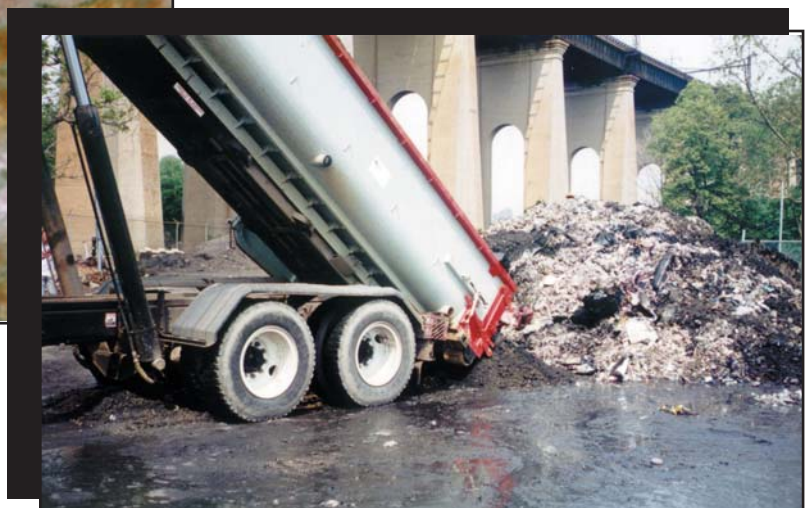

Municipalities incorporate various types of Container Filters in removing free water from grit and bar screen material. Once the material has had time to dewater adequately, it is transported to an approved disposal site.

Pictured are three applications where Container Filters are being used to dewater waste. The locations of these applications are Kouts, Indiana; Austin, Texas and New York City.

Roll-off Container Filters come in sizes ranging from 20 cubic yards to 40 cubic yards. Self Dumping Container Filters are available up to 5 cubic yards and Dumpster Models are available up to 6 cubic yards.
